Beginners Startup Guide

A) Assumption - We can find at least one JS file in a folder we can see.
B) Open the folder in Terminal Mode
C) Type **Node**
D) Make sure you have the folder open as {A}
   **==> It is all ready to be set up**

E) Open the file referred to as {A}
F) Highlight the first few letters of the starting code
G) From the [Run] menu, pick Breakpoint or push **{f9}**
H) Push **{f5}** to start debugging
        ==> The Debug bar appears (as in the picture below)

I) If you ever get that far; that's it NOW you can just push**{f11}**

J) By referring to the code as defer src="./main.js"
   you can run it off the HTML.

K) Note on {J}, async src="./main.js" does about the same.
      You could just leave out either. What you CAN'T do
      easily is type = "module".

L) Most important; If you expect to overwrite variables
      DIRECTLY from the console – declare them using
      var rather than **const** or **let**.
